

Centralization increases knight options

Chess Math

THE IDEA

A knight on an empty central square may have eight destinations; a corner knight has two. This is a geometric reason for developing toward the center. Occupancy, pawn attacks, and the role of a specific outpost still matter more than raw mobility.

WORKED EXAMPLE

From a1 a knight reaches b3 and c2. From d4 it reaches eight squares. Moving toward the center can multiply options, but a central square controlled by an enemy pawn may be unusable.

TRY IT BEFORE READING ON

Does eight geometric moves mean eight good moves?

ANSWER AND REASONING

No. Some destinations may be occupied by friendly pieces, attacked, tactically losing, or irrelevant. Count legal and useful mobility after checking the empty-board pattern.

TAKE THIS INTO YOUR NEXT GAME

Mobility is potential; safe activity turns it into value.
