

Allocate study time with a purpose

Chess Math

THE IDEA

Time budgets are arithmetic expressions of priorities. A useful schedule assigns minutes to the skill causing your losses and still includes slow play and review. No universal ratio fits every player, so adjust after examining recent games.

WORKED EXAMPLE

For a 60-minute session, 20 minutes of calculation, 20 of game review, 10 of endgames, and 10 of opening repair add to 60. The opening block should answer a concrete recurring problem rather than grow indefinitely.

TRY IT BEFORE READING ON

If review expands to 30 minutes, how can the session remain one hour?

ANSWER AND REASONING

For example use 15 calculation, 30 review, 10 endgame, and 5 opening minutes. The change deliberately favors diagnosis. Reassess after several games to see whether the identified errors decline.

TAKE THIS INTO YOUR NEXT GAME

Make study minutes serve observed weaknesses.
