

Discovered attacks use two pieces

Thinking And Training

THE IDEA

A discovered attack occurs when one piece moves away and reveals an attack by a piece behind it. The moving piece can make its own threat, creating a double attack. The destination of the blocker is often the key to the combination.

WORKED EXAMPLE

A knight moves off a bishop's diagonal, revealing an attack on the queen while the knight attacks a rook. If the knight also gives check, the opponent's choices may become especially restricted.

TRY IT BEFORE READING ON

How do you search for a discovered attack?

ANSWER AND REASONING

Look for your sliders lined up behind your own pieces toward enemy targets. Then find legal moves for the blocker that create checks, captures, or useful threats of their own.

TAKE THIS INTO YOUR NEXT GAME

Before moving a blocker, inspect the line it will uncover.
